

Proposed change to rtp-usage

Discussion on the list to change requirement for non-multiplexed RTCP:

- target="RFC5761"></xref>. Such RTP and RTCP multiplexing MUST be
- negotiated in the signalling channel before it is used. If SDP is used
- for signalling, this negotiation MUST use the attributes defined in
- <xref target="RFC5761"></xref>. For backwards compatibility,
- implementations are also REQUIRED to support RTP and RTCP sent on
- separate transport-layer flows.</t>
+ <xref target="RFC5761"></xref>. Implementations MAY support RTP and
+ RTCP sent on separate transport-layer flows. They MAY also refuse to
+ do so, in which case any negotiation that results in multiplexing not
+ being negotiated is treated as a failure.</t>

<t>Note that the use of RTP and RTCP multiplexed onto a single
transport-layer flow ensures that there is occasional traffic sent on

Is there consensus to make this change?
