

Introduction to Real-Time Systems

Real-Time and Embedded Systems (M)

Lecture 1

UNIVERSITY
of
GLASGOW

Lecture Outline

- Administrivia
 - Aims and objectives
 - Intended learning outcomes
 - Prerequisites
 - Module outline and timetable
 - Reading list
 - Assessment
- Introduction to real-time systems
 - Examples
 - Types of real-time system
 - Implementation considerations

Lecturer Contact Details

Dr. Colin Perkins
Sir Alwyn Williams Building, room 405

Email: csp@dcg.gla.ac.uk

Willing to discuss the module and answer
questions – *make appointments by email*

<http://fims.moodle.gla.ac.uk/course/view.php?id=136>

Aims of This Module

- To introduce and explore the programming language and operating systems facilities essential to the implementation of real-time, reactive, embedded and networked systems.
- To provide the participants with an understanding of the practical engineering issues raised by the design and programming of real-time, reactive, embedded and networked systems.

Intended Learning Outcomes

- By the end of this module participants should be able to:
 - Clearly differentiate the different issues that arise in designing soft and hard real-time, concurrent, reactive, safety-critical and embedded systems.
 - Explain the various concepts of time that arise in real-time systems.
 - Analyse and apply a variety of static and dynamic scheduling mechanisms suitable for soft and hard real-time systems. Conduct simple performance and schedulability analysis to demonstrate that a system can successfully meet real-time constraints.
 - Explain the additional problems that arise in developing distributed and networked real-time systems.
 - Describe the design and implementation of systems that support real-time applications. Justify and critique facilities provided by real-time operating systems and networks.
 - Design, construct and analyse a small, concurrent, reactive, real-time system. Select and use appropriate engineering techniques, and explain the effect of your design decisions on the behaviour of the system.

Prerequisites

- Students are expected to have done degree-level studies in, and be familiar with, operating systems design and implementation, concurrency and threaded programming, and software analysis and design.
- Some basic familiarity with formal reactive systems modelling techniques and safety critical system design would complement the engineering issues addressed in this module
 - The MRS4 and SCS4 modules cover that material, but are not formal co- or pre-requisites

Module Outline

- Introduction to Real-Time and Embedded Systems
 - Reference Model
 - Hard versus soft real-time
- Job Scheduling
 - Clock driven scheduling algorithms
 - Priority driven scheduling algorithms
 - Schedulers in commodity and real-time operating systems
- Resource access control
 - Algorithms
 - Implementation
- Real-time communication
 - On best-effort networks
 - Enhanced quality of service
- Other implementation considerations

Timetable

Week:	Tue 14:00-15:00	Wed 10:00-11:00	Thu 10:00-11:00
14	Lecture 1	Lecture 2	Lecture 3
15	Tutorial 1	Lecture 4	Lecture 5
16	Lecture 6	Tutorial 2	Lecture 7
17	Lecture 8	Tutorial 3	Lecture 9
18	Lecture 10	Lecture 11	Lecture 12
19	Tutorial 4	Lecture 13	Lecture 14
20	Tutorial 5	Lecture 15	Lecture 16
21	Individual work on programming assignment		
22	Lecture 17	Tutorial 6	Lecture 18
23	Lecture 19	Lecture 20	

Timetable

Week 14	Lecture 1	Introduction to Real-Time Systems
	Lecture 2	A Reference Model for Real-Time Systems
	Lecture 3	Overview of Real-Time Scheduling
Week 15	Tutorial 1	The Basics of Real-Time Systems
	Lecture 4	Clock-Driven Scheduling
	Lecture 5	Priority-driven Scheduling of Periodic Tasks (1)
Week 16	Lecture 6	Priority-driven Scheduling of Periodic Tasks (2)
	Tutorial 2	Scheduling Algorithms (1)
	Lecture 7	Priority-driven Scheduling of Aperiodic and Sporadic Tasks (1)
Week 17	Lecture 8	Priority-driven Scheduling of Aperiodic and Sporadic Tasks (2)
	Tutorial 3	Scheduling Algorithms (2)
	Lecture 9	Implementing Scheduling Algorithms
Week 18	Lecture 10	Real-Time Operating Systems and Languages (1)
	Lecture 11	Real-Time Operating Systems and Languages (2)
	Lecture 12	Real-Time on General Purpose Systems

Timetable

Week 19	Tutorial 4	Real-Time Operating Systems and Languages
	Lecture 13	Resource Access Control (1)
	Lecture 14	Resource Access Control (2)
Week 20	Tutorial 5	Resource Access Control
	Lecture 15	Introduction to Real-Time Communications
	Lecture 16	Real-Time Communication on IP Networks
Week 21	Individual Work on Programming Assignment	
Week 22	Lecture 17	Quality of Service for Packet Networks
	Tutorial 6	Real-Time Communications/Q&A on Programming Assignment
	Lecture 18	Low-Level and Embedded Programming (1)
Week 23	Lecture 19	Low-Level and Embedded Programming (2)
	Lecture 20	Review of Major Concepts

Lectures and Tutorials

- Lectures:
 - Highlight relevant material from the book
- Tutorials:
 - Practice problem solving, review material covered in lectures
 - Expect to do worked examples and answer questions!

Assessment

- Level M module, worth 10 credits
- 3 Problem sets (each worth 5% of total mark)
 - Problem set 1: available in lecture 3, due 1:00pm on 26th January
 - Problem set 2: available in lecture 6, due 1:00pm on 2nd February
 - Problem set 3: available in lecture 8, due 1:00pm on 9th February
 - Hard deadlines: late submissions will receive zero marks unless valid special circumstances form submitted
- Programming assignment (15% of total mark)
 - Available in lecture 15, due at 1pm on 16th March
 - Will involve real-time network programming in C
- Written examination (70% of total mark)
 - All material in the lectures, tutorials and background reading is examinable
 - Aim is to test your understanding of the material, not to test your memory of all the details; explain why – don't recite what

Reading

- Jane W. S. Liu, “Real-Time Systems”, Prentice-Hall, 2000, ISBN 0130996513
 - This book comprises the lecture notes for the module and is *required reading* for all students
 - *All material in this book is examinable*
- Bill Gallmeister, “POSIX.4: Programming for the Real-World”, O’Reilly and Associates, 1995, ISBN 1565920740
 - *Optional*, but provides further detail on the practical aspects of the module

Real-Time and Embedded Systems

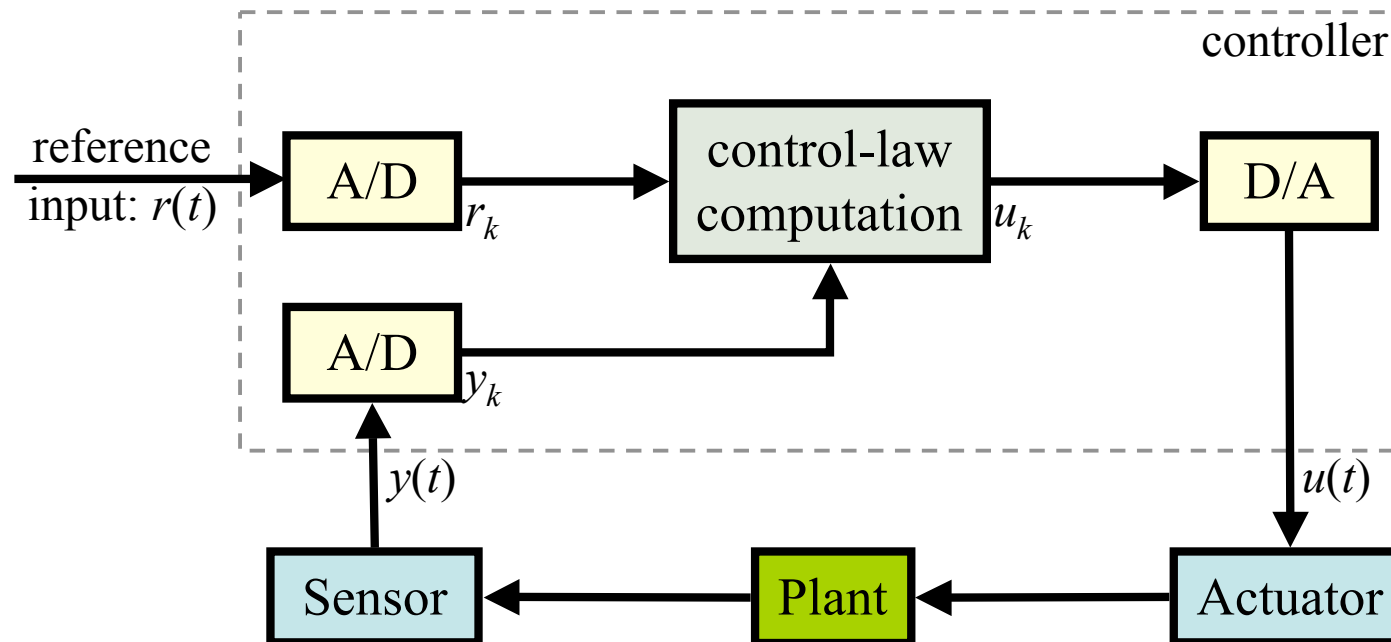

- A *real-time* system must deliver services in a timely manner
 - *Not* necessarily fast, but must meet some timing deadline
- An *embedded* system is hidden from view within a larger system
- Many real-time and embedded systems exist, often without the awareness of their users
 - Washing machine, photocopier, mobile phone, car, aircraft, industrial plant, microwave oven, toothbrush, CD player, medical devices, etc.
- Must be able to validate real-time systems for correctness
 - Some embedded real-time systems are safety critical – i.e. if they do not complete on a timely basis, serious consequences result
 - Bugs in embedded real-time systems are often difficult or expensive to fix

Real-Time and Embedded Systems

- This module will discuss several representative classes of real-time and embedded system:
 - Digital process control
 - Higher-level command and control
 - Tracking and signal processing
 - Real-time databases
 - Telephony and multimedia
- Algorithms for scheduling tasks such that those systems complete in a reliable and timely fashion
- Implementation techniques, operating systems and languages for building such systems

Digital Process Control

- Controlling some device (the “plant”) using an actuator, based on sampled sensor data
 - $y(t)$ is the measured state of the plant
 - $r(t)$ is the desired state of the plant
 - Calculate control output $u(t)$ as a function of $y(t)$, $r(t)$

Digital Process Control

- Pseudo-code for the controller:

```
set timer to interrupt periodically with period  $T$ ;  
at each timer interrupt, do  
    do analogue-to-digital conversion of  $y(t)$  to get  $y_k$ ;  
    compute control output  $u_k$  based on reference  $r_k$  and  $y_k$ ;  
    do digital-to-analogue conversion of  $u_k$  to get  $u(t)$ ;  
end do;
```

- Effective control of the plant depends on:
 - The correct control law computation and reference input
 - The accuracy of the sensor measurements:
 - Resolution of the sampled data (i.e. bits per sample)
 - Timing of the clock interrupts (i.e. samples per second, $1/T$)

Digital Process Control

- The time T between any two consecutive measurement of $y(t)$, $r(t)$ is the *sampling period*
 - Small T better approximates the analogue behaviour
 - Large T means less processor-time demands
 - Must achieve a compromise
- If T is too large, oscillation will result as the system tries to adapt

Digital Process Control

- How to choose sampling period?
 - *Rise time* – the amount of time that the plant takes to reach some small neighbourhood around the final state in response to a step change in the reference input
 - If R is the rise time, and T is the period, a good rule of thumb is that the ratio $10 \leq R/T \leq 20$
- Must be chosen correctly, and accurately implemented to ensure stability
- Multi-rate systems – system is composed of multiple sensors and actuators, each of which require different sampling periods
 - Need to run multiple control loops at once, accurately
 - Usually best to have the sampling periods for the different degrees of freedom related in a harmonic way

Example: Helicopter Flight Control

Do the following in each 1/180-second cycle:

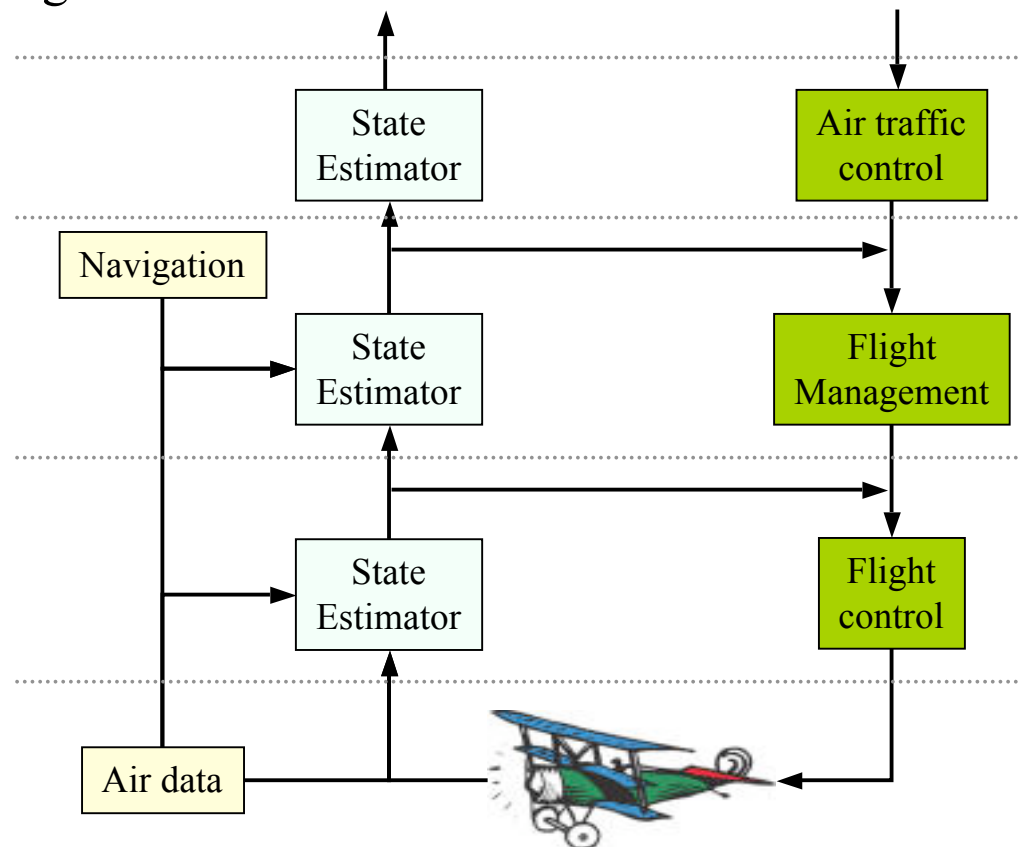

- Validate sensor data and select data source; on failure reconfigure the system
- Do the following 30-Hz avionics tasks, each once every 6 cycles:
 - Keyboard input and mode selection
 - Data normalization and coordinate transformation
 - Tracking reference update
- Do the following 30-Hz computations, each once every 6 cycles
 - Control laws of the outer pitch-control loop
 - Control laws of the outer roll-control loop
 - Control laws of the outer yaw- and collective-control loop
- Do each of the following 90-Hz computations once every 2 cycles, using outputs produced by the 30-Hz computations
 - Control laws of the inner pitch-control loop
 - Control laws of the inner roll- and collective-control loop
- Compute the control laws of the inner yaw-control loop, using outputs from the 90-Hz computations
- Output commands to control surfaces
- Carry out built-in-test

Digital Process Control

- Digital controllers make three assumptions:
 - Sensor data give accurate estimates of the state-variables being monitored and controlled - noiseless
 - The sensor data gives the state of the plant – usually must compute plant state from measured values
 - All parameters representing the dynamics of the plant are known
- If any of these assumptions are not valid, a digital controller must include a model of the correct system behaviour
 - Estimate actual state based on noisy measurement each iteration of the control loop
 - Use estimated plant state instead of measured state to derive control output
 - Often requires complex calculation, modelling
- We'll cover scheduling dynamics; the system model is domain-specific

Higher-Level Control

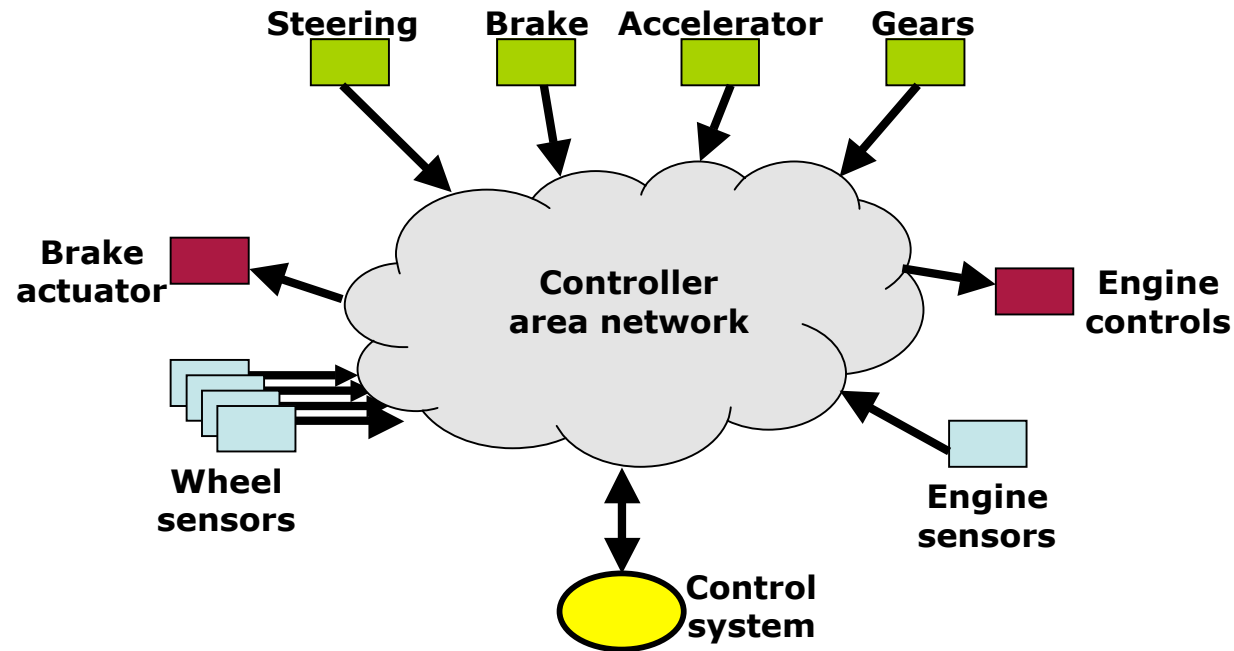

- Controllers often organized in a hierarchy
 - Multiple control loops, higher level controllers monitoring the behaviour of low-level controllers
 - Time-scale, complexity of decision making, increases as go up hierarchy;
Move from control to planning
 - Higher level planning must still be done in real-time, although deadlines are less tight

Real-Time Communications

- Real-time systems are increasingly distributed, including communication networks
 - Control loop may include a communication step
 - System may depend on network stimuli
- Not only does a system need to run a control law with time constraints, it must also schedule communications, sending and receiving messages according to deadlines

Example: Drive by Wire

- All data must be delivered reliably
 - Bad if you turn the steering wheel, and nothing happens
- Commands from control system have highest priority, then sensors and actuators, then control inputs
 - Anti-lock brakes have a faster response time than the driver, so prioritise to ensure the car doesn't skid
- Network must schedule and prioritise communications

Example: Packet Voice

- Voice is digitised and sent as a sequence of packets
 - Constant spacing, every 10-30ms depending on codec
- Strict timeliness requirement
 - Mouth to ear delay needs to be less than approximately 150ms
 - Packets must be played out with equal spacing
- Relaxed reliability requirement
 - Some small fraction of packets can be lost, and just sound like crackles on the wire; most need to arrive
- Emergency calls may have priority

Types of Real-Time Application

- Purely cyclic
 - Every task executes periodically
 - Demands in (computing, communication, and storage) resources do not vary significantly from period to period
 - Example: most digital controllers and real-time monitors
- Mostly cyclic
 - Most tasks execute periodically
 - The system must also respond to some external events (fault recovery and external commands) asynchronously
 - Example: modern avionics and process control systems
- Asynchronous: mostly predictable
 - Most tasks are not periodic
 - The time between consecutive executions of a task may vary considerably, or the variations in resource utilization in different periods may be large
 - These variations have either bounded ranges or known statistics
- Asynchronous: unpredictable
 - Applications that react to asynchronous events and have tasks with high run-time complexity
 - Example: intelligent real-time control systems

Types of Real-Time Application

- As we will see later, the type of application affects how we schedule tasks, prove correctness
- It is easier to reason about applications that are more cyclic, synchronous and predictable
 - Many real-time systems designed in this manner
 - Safe, conservative, design approach, if it works for your application

Implementation Considerations

- Some real-time embedded systems are complex, implemented on high-performance hardware
 - Industrial plant control
 - Civilian flight control
- Many must be implemented on hardware chosen to be low cost, low power, light-weight and robust; with performance a distant concern
 - Military flight control, space craft control
 - Consumer goods
- Often-times implemented in C or assembler, fitting within a few kilobytes of memory
 - Correctness a primary concern, efficiency a close second

Summary

- Outline of the module structure, assessment, etc.
- Introduction to real-time and embedded systems
 - Examples of digital control, higher-level control, communication
- Types of real-time system
 - Cyclic synchronous vs. asynchronous and unpredictable
- Implementation considerations

[Liu chapter 1]
